

Similar to leaky toilet problems, a leaky faucet will involve some inspection of seals and parts. Most leaky faucets are caused by a de-threaded screw/washer, a bad valve seal, a missing o-ring or things of that sort.

In many cases, it's less expensive to simply replace your faucet outright, rather than spend hours investigating or replacing parts to an outdated faucet. Why? Because if you replace one part on an old faucet system, it's only a matter of time before another part of the faucet breaks down. If you have an older faucet, save yourself the time and energy by replacing the whole thing.
